

The Optimization of Server Cooler

Homeming Technology Co., 泓銘科技公司

總經理 陳恆隆 11 / 13 / 2013

Content

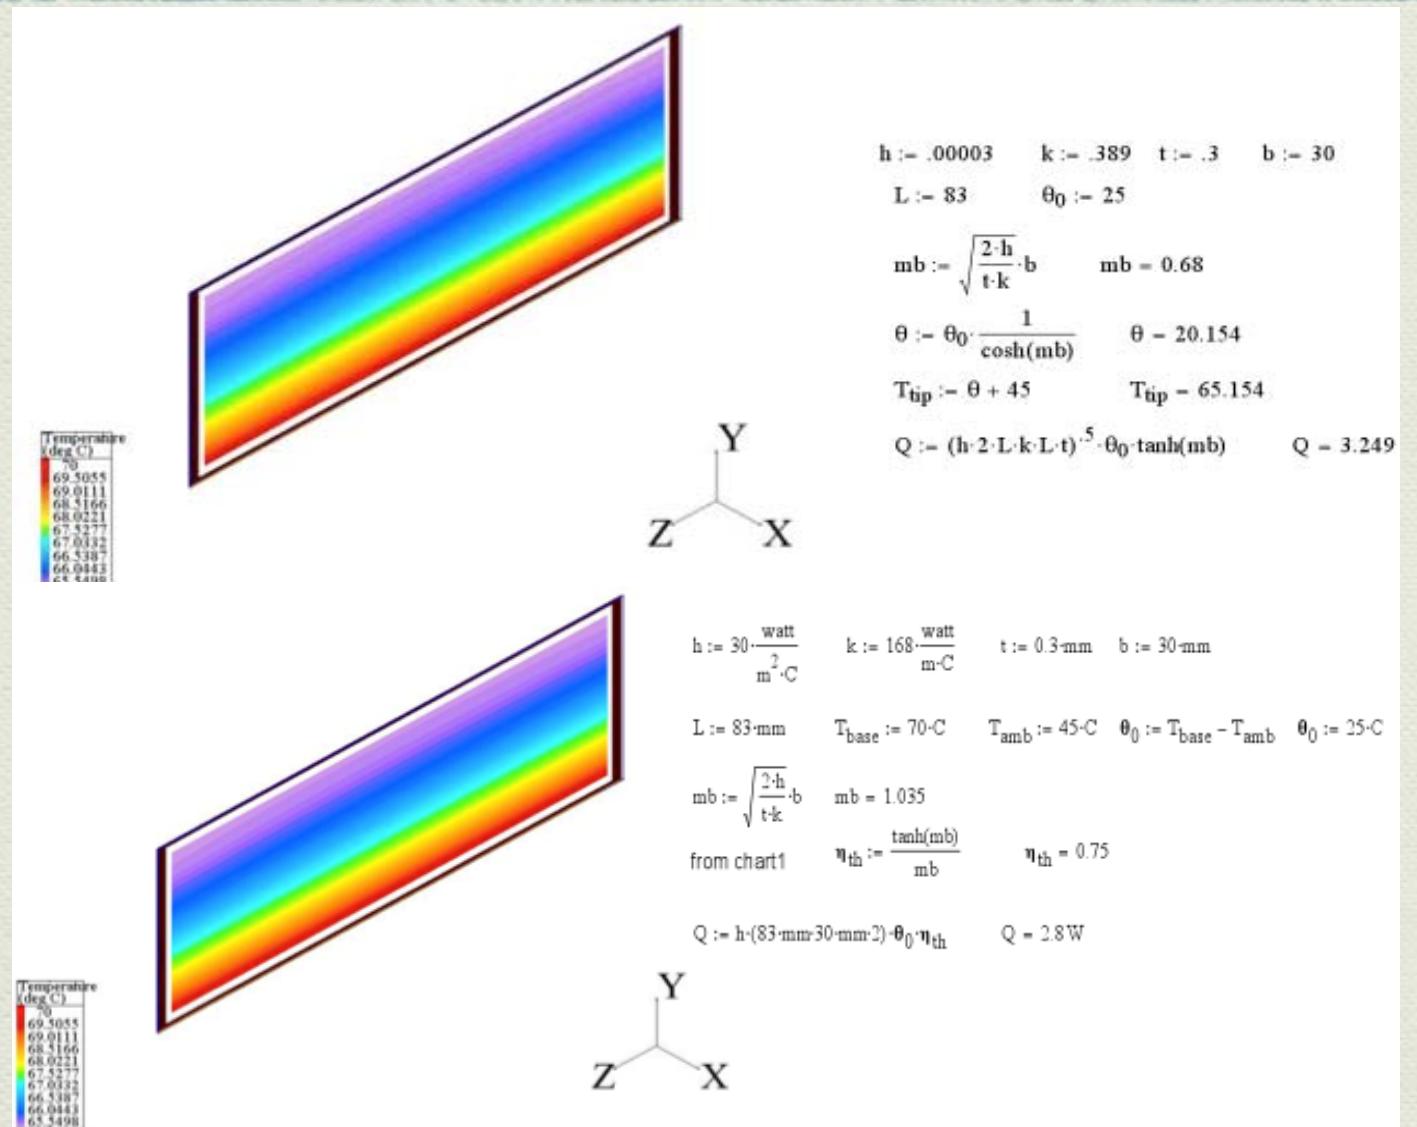

- ◆ Project Motivation
- ◆ Model Correlation of Flotherm and Theoretical Result
- ◆ Boundary Layer Effect on Fin surface
- ◆ Effect of Velocity Profile on Single Fin
- ◆ Mathematical Thermal Analysis on Fin with Variable Velocity
- ◆ Optimization of Interleaved Cut on Fin
- ◆ Conclusion

Project Motivation

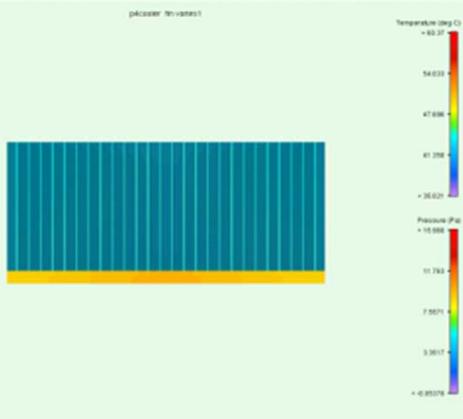

- ◆ PC market is eroded by tablets by 20-30% in 2013
 - ◆ Result - margin is leaner & leaner!
- ◆ Server demand is booming due to cloud application
 - ◆ Result - PC suppliers shift to server side, more competition, leaner profit !
- ◆ Conclusion: Heat sink suppliers try to down the weight to reduce the material cost or recover margin from scraps.

Model Correlation of Flotherm and Theoretical Result

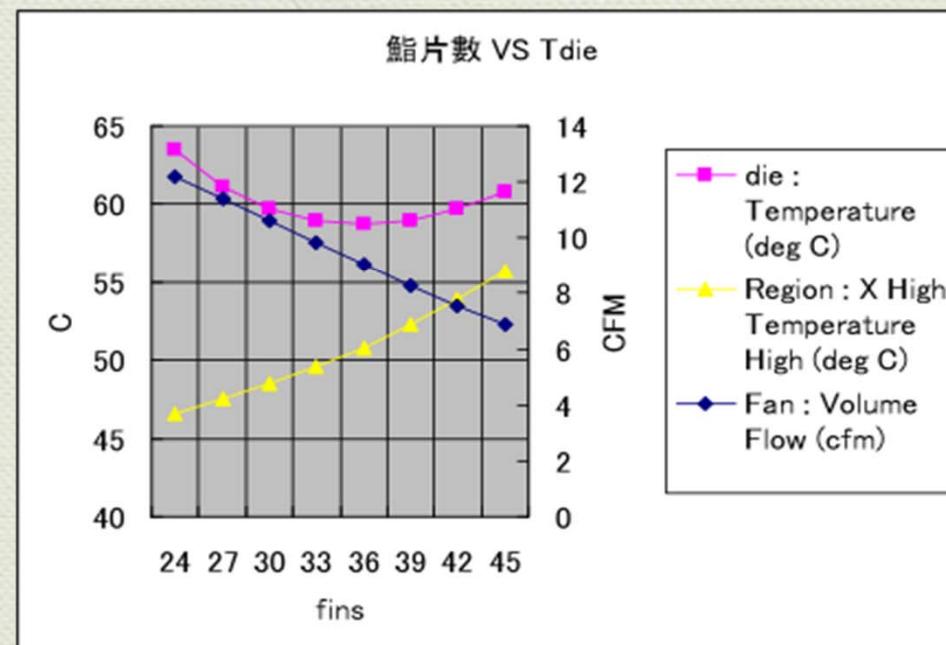

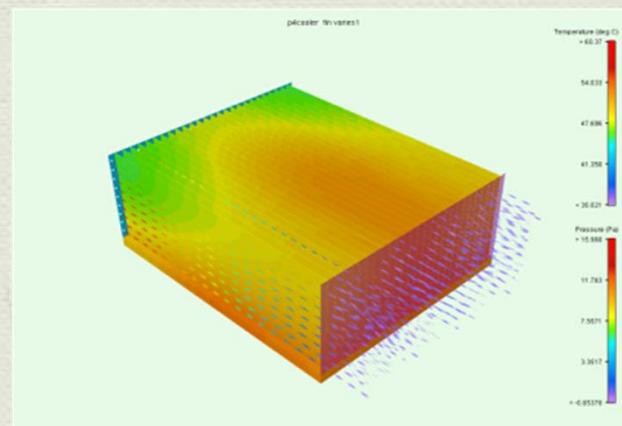

- Fin dimension:
20H*83L*0.3t
- Base temp Tb=70C,
ambient Ta=45C
- Material : copper k=389
w/m°C
- Theoretical Ttip=65.1 C
- Flotherm result 65.18C

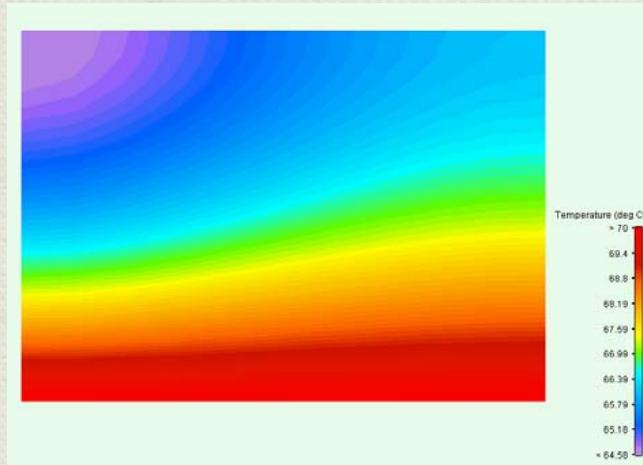

Flotherm Verification for Variable Parameters Trend Prediction

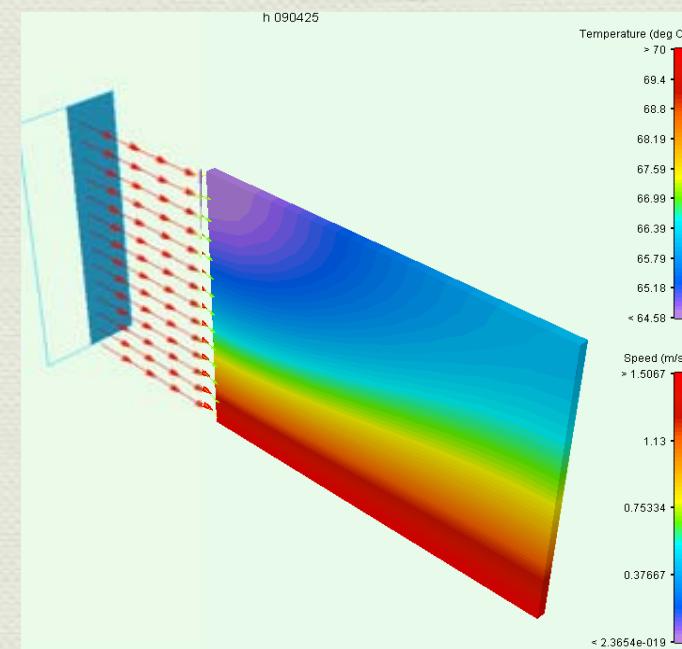

Heat Sink 1 : Number Of Internal Fins	24	27	30	33	36	39	42	45
die : Temperature (deg C)	63.46	61.15	59.7	58.92	58.71	58.98	59.68	60.78
Fan : Volume Flow (cfm)	12.21	11.4	10.6	9.808	9.027	8.268	7.543	6.855
Region : X High Temperature High (deg C)	46.61	47.51	48.47	49.55	50.81	52.25	53.88	55.72

CALCULATION BY FLOTHERM SIMULATION FOR NON-UNIFORM dT in dY DIRECTION

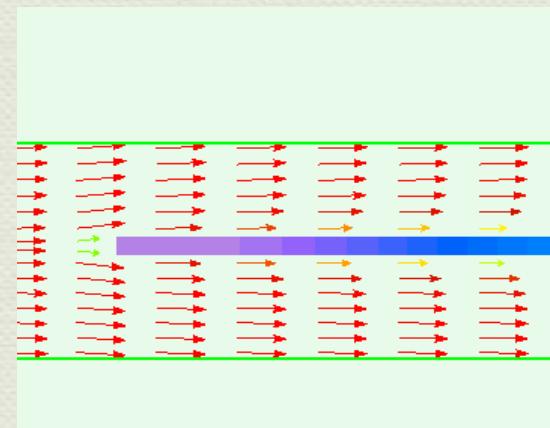

Conv Heat Net (W)	Conv Heat Transfer Coefficient (W/(m ² K))
-0.012947	13.7271
-1.2125	31.5351
-1.2172	31.6574
-2.44265	

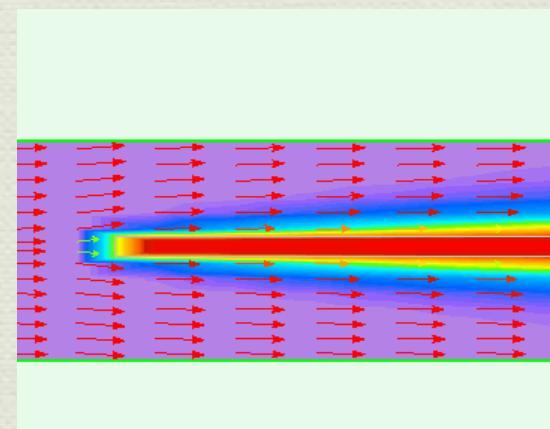

Boundary Layer on Fin Surface

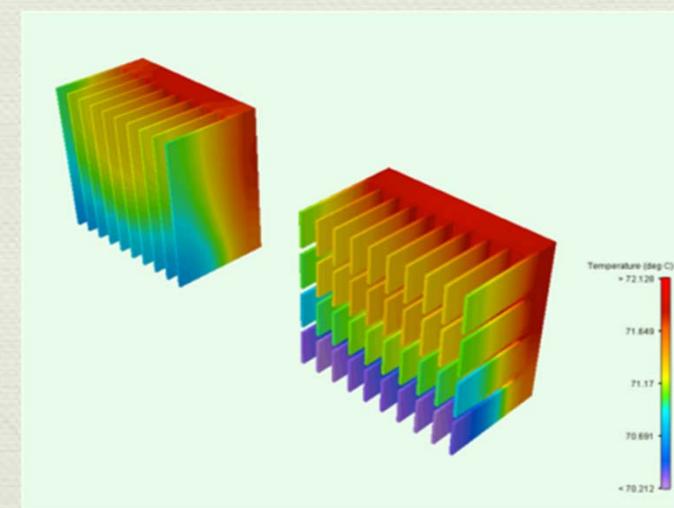

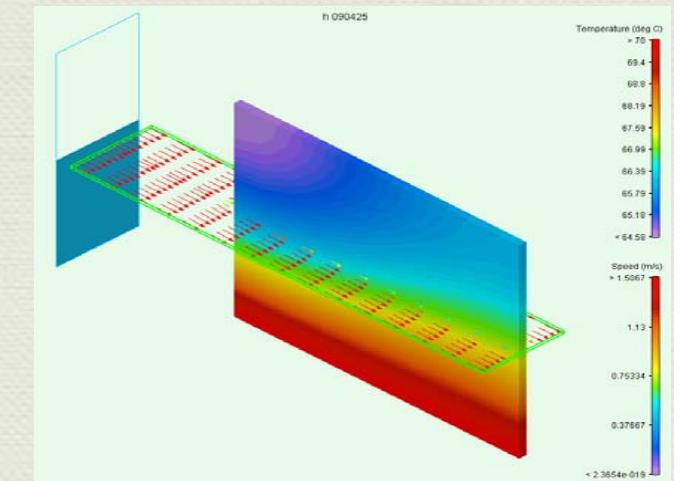

- ◆ Flotherm is a good tool for boundary analysis

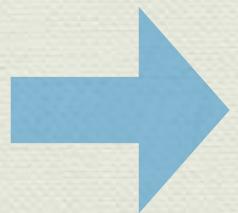

- ◆ Layer is thicker towards the end of fin

- ◆ Break boundary layer for h enhancement

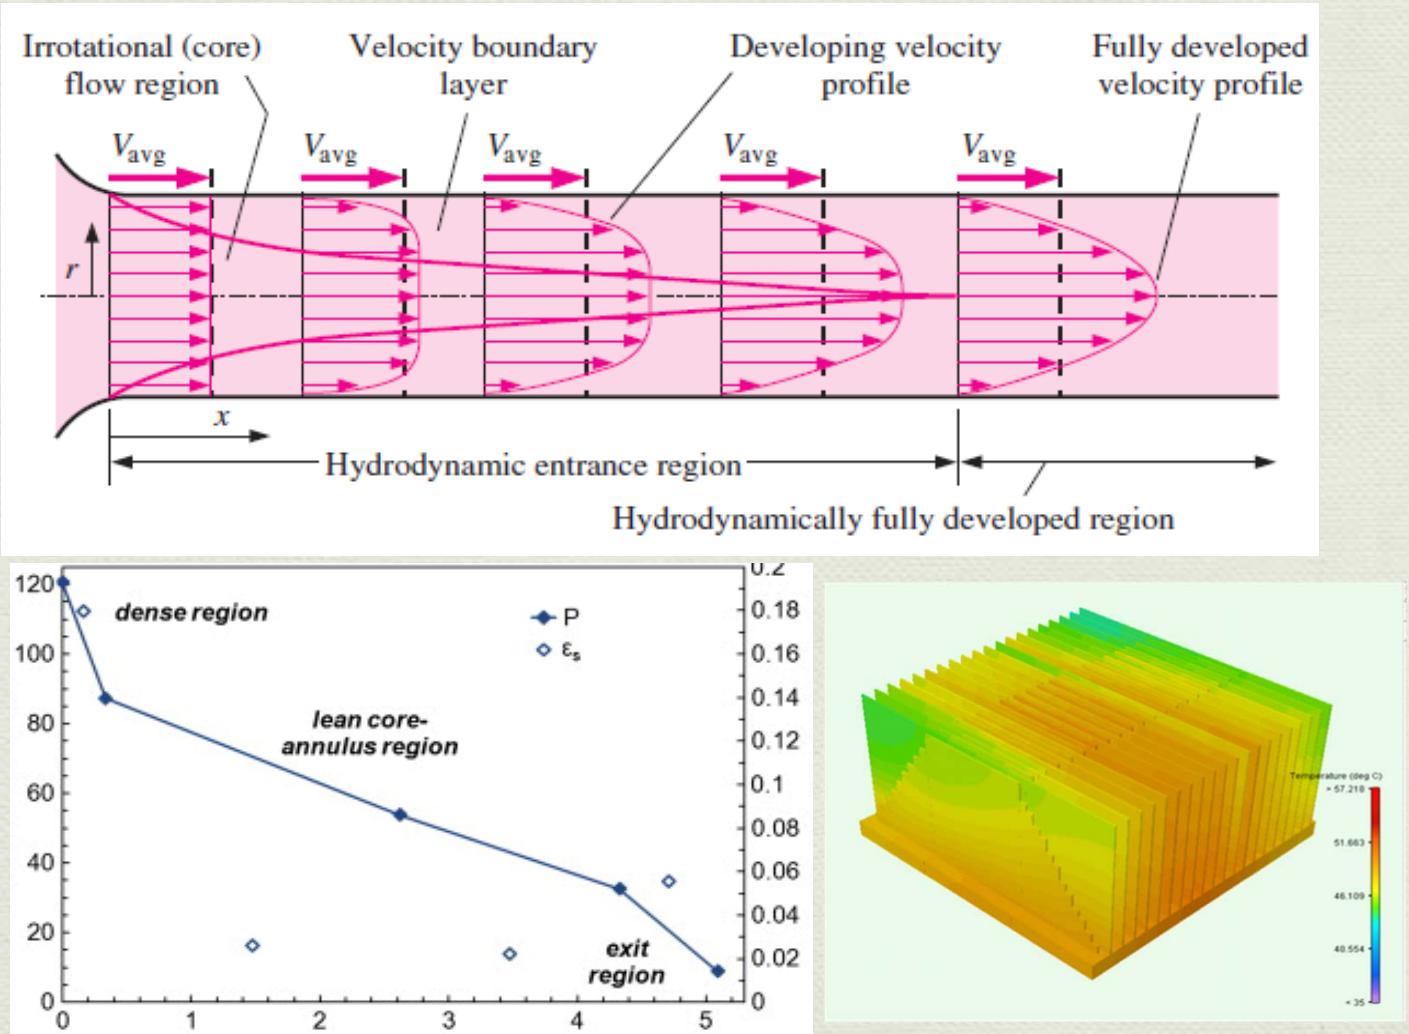

Break Boundary for h Enhancement Applying in CPU Cooler

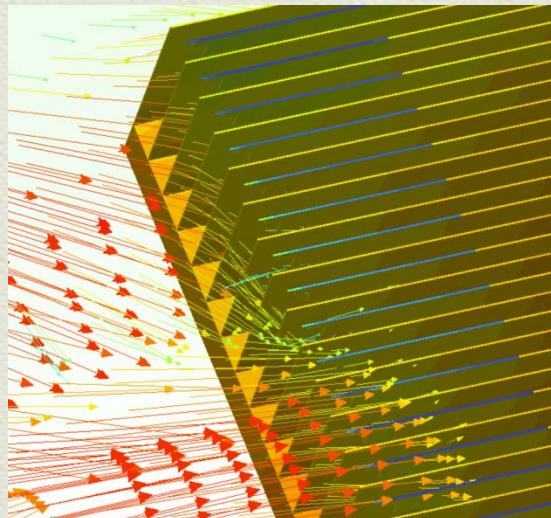

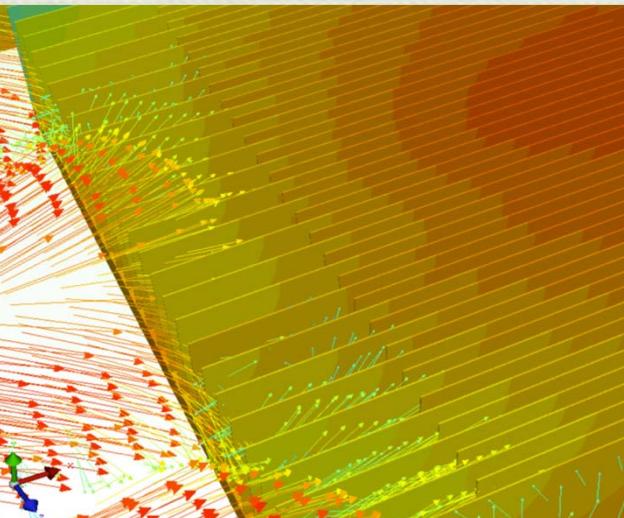

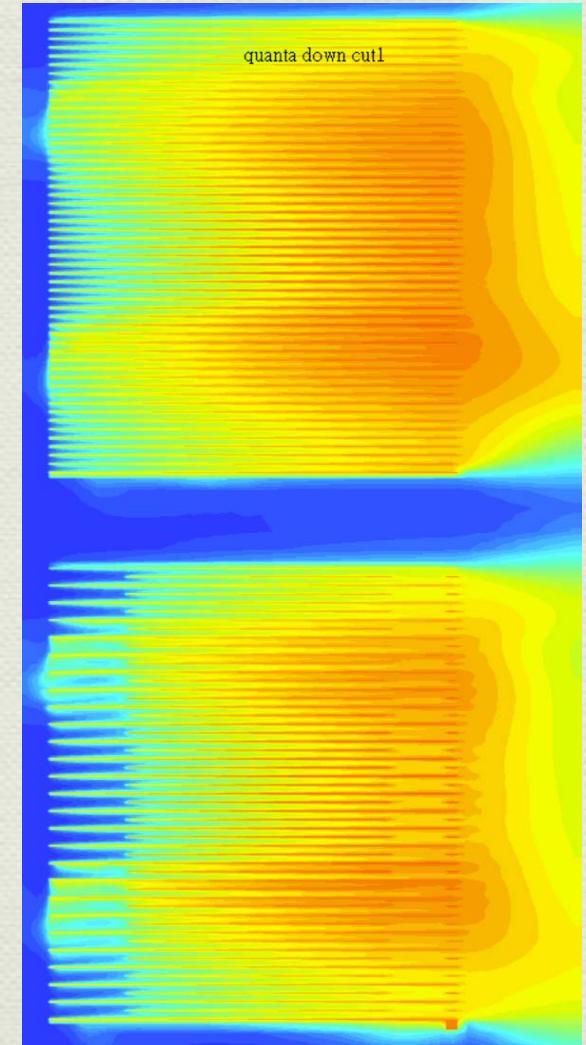

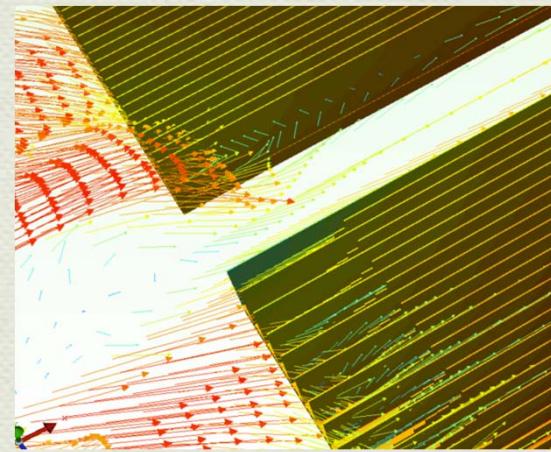

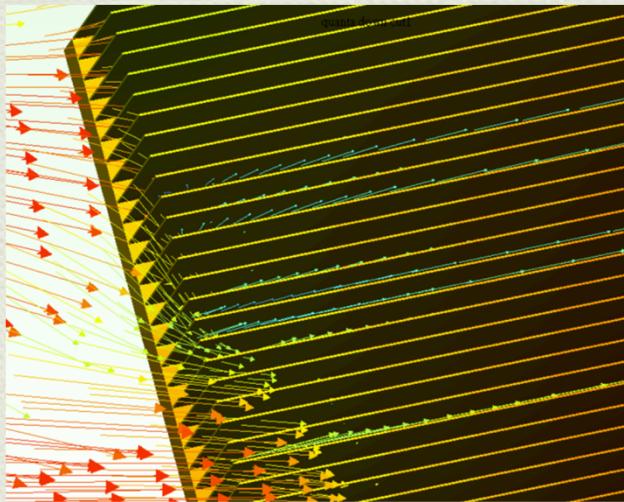

15%

Pressure Drop in Channel Flow

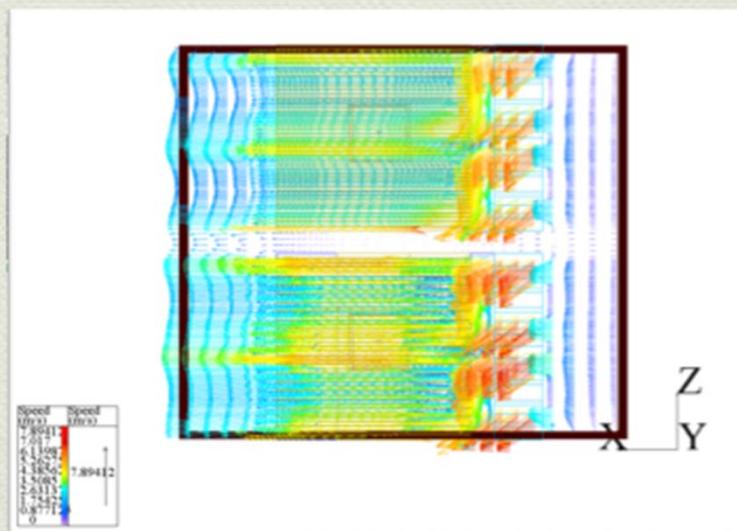

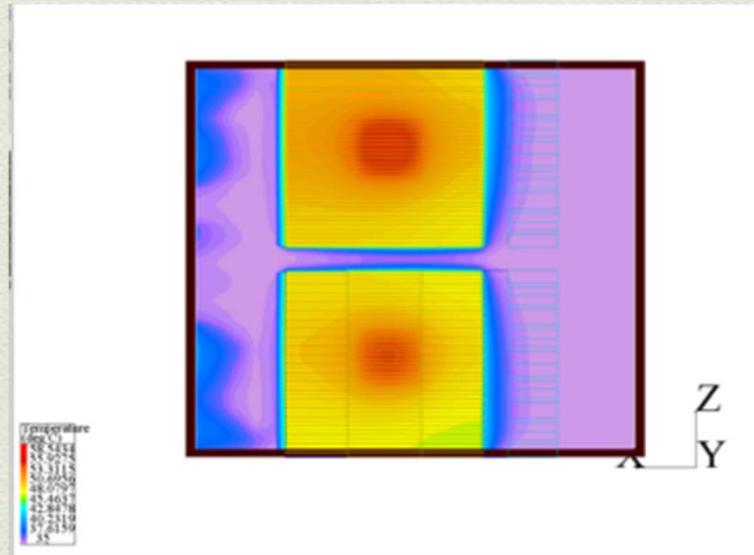

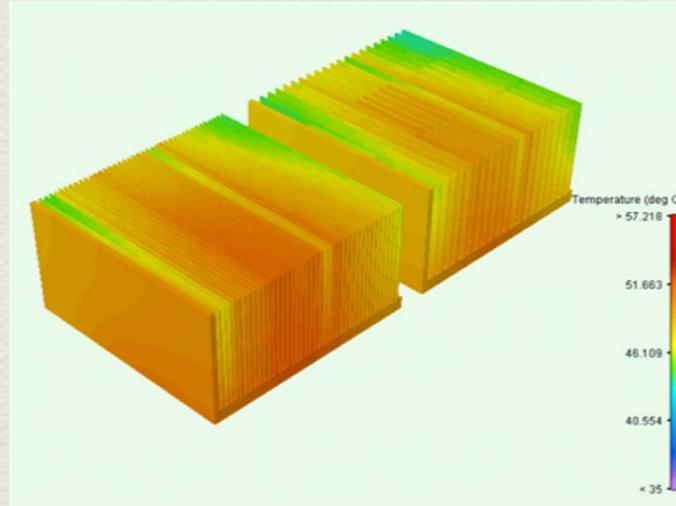

- ◆ Pressure loss the most in fin module entrance due to flow duct contraction
- ◆ If flow is from axial fan, the entrance loss is worsen due to swirling effect of rotating fan blades
- ◆ Interleaved trapezoidal fin module design is adopted for entrance pressure loss reduction

Huge Entrance Pressure in Fan Swirling

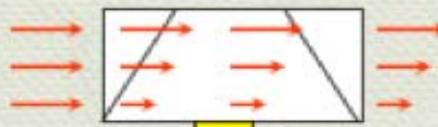

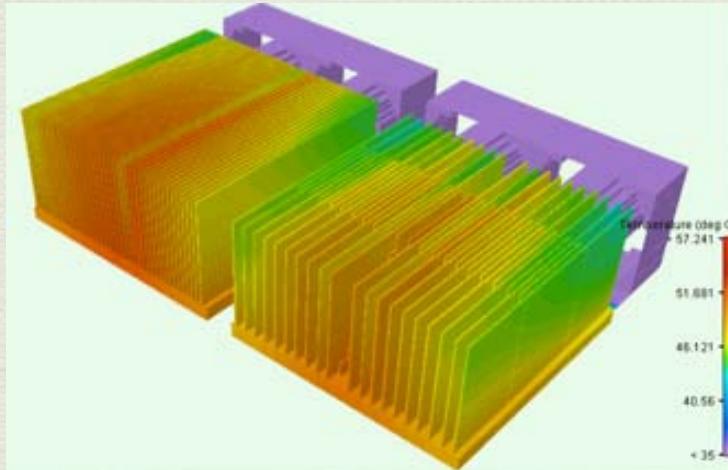

Interleaved Trapezoidal Fin Module Simulation Result

	die temp(C)	airflow	Pressure loss (pa)
RECTANGULAR FINS	58.62	9.8	29.1
INTERLEAVE TRAPEZODIAL FINS	57.65	11.2	23.18

ITFM Technology on Desktop Cooler

- Performance UP : **2%**
- Weight DOWN : **12%**
- Noise down : 2dB

	INTERLEAVE TRAPEZOIDAL FINS	CONTINUOUS RECTANGULAR FINS
Weight	10%	100%
Performance	2%	0%
Noise	-2dB	0dB
Space	10%	100%

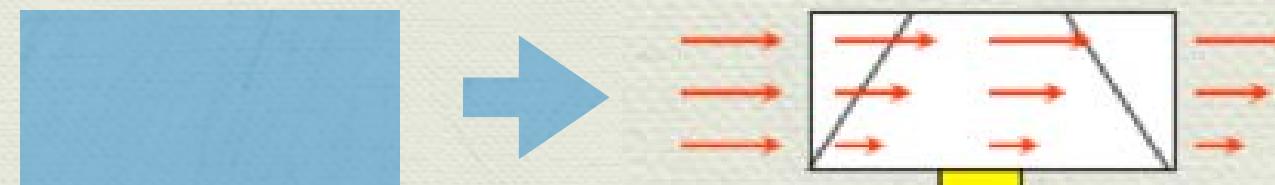

Interleaved Trapezoidal Applied in CPU Cooler

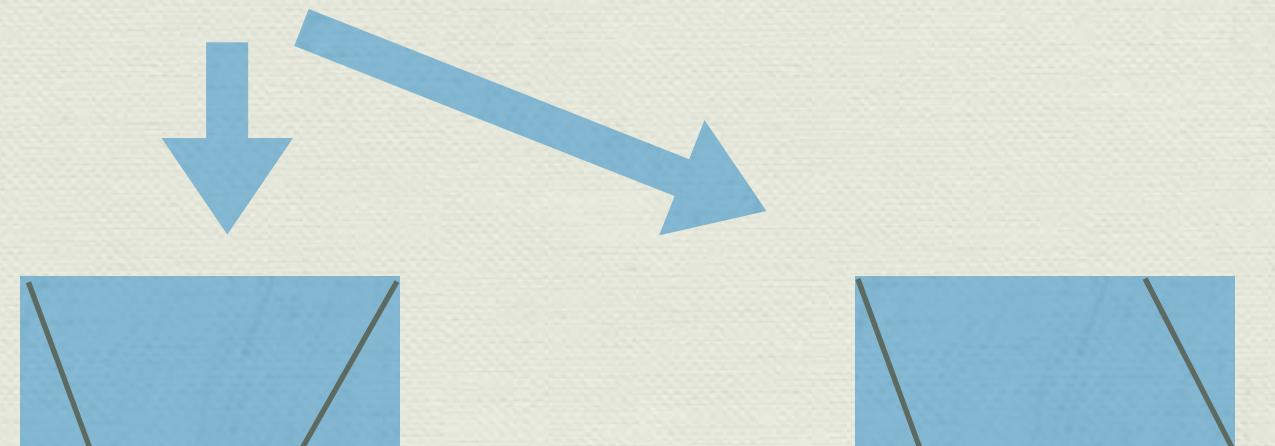

Variations of Entrance Cut & Exit Cut

- ◆ Entrance trig-cut reduces pressure drop, increase CFM

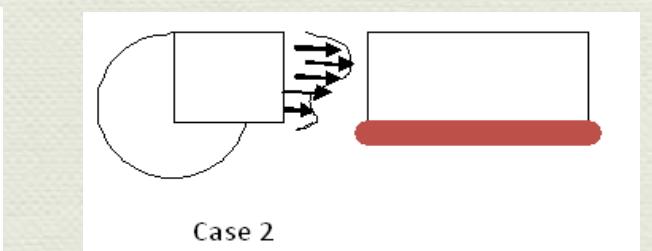

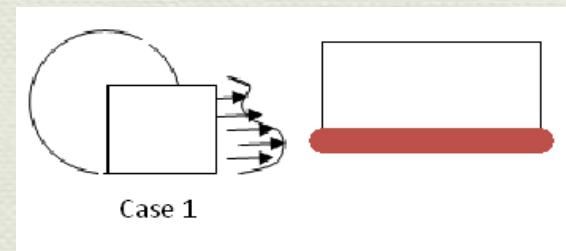

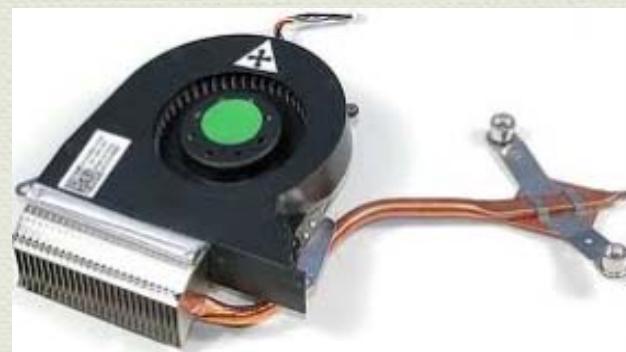

- ◆ What if inverse the front trig-cut & exit trig-cut for case 1 & 2?

- ◆ What if entrance flow is asymmetrical instead of uniform ?

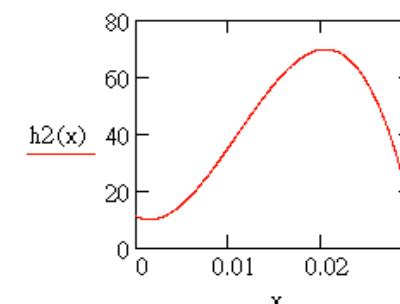

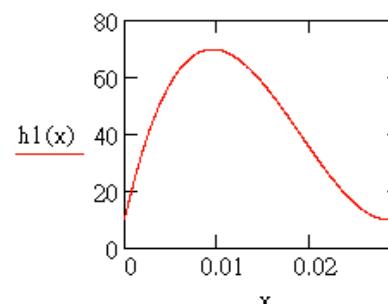

When Velocity Profile is Not Uniform?

- ◆ Blower fan's velocity profiles is asymmetrical from one end to the other
- ◆ Axial fan's velocity profile is diagonally symmetrical
- ◆ h is function of velocity $h=h(v)$ which can be experimentally measured or obtained from Flotherm from data base
- ◆ Same blower with different orientation on an vertical fin, Q difference can be theoretically analyzed

$$h_1(x) := 1.415 \times 10^4 \cdot x + -9.921 \times 10^5 \cdot x^2 + 1.739 \times 10^7 \cdot x^3 + 10.145$$

$$h_2(x) := 1.415 \times 10^4 \cdot (b - x) + -9.921 \times 10^5 \cdot (b - x)^2 + 1.739 \times 10^7 \cdot (b - x)^3 + 10.145$$

Theoretical Calculation for Model Correlation

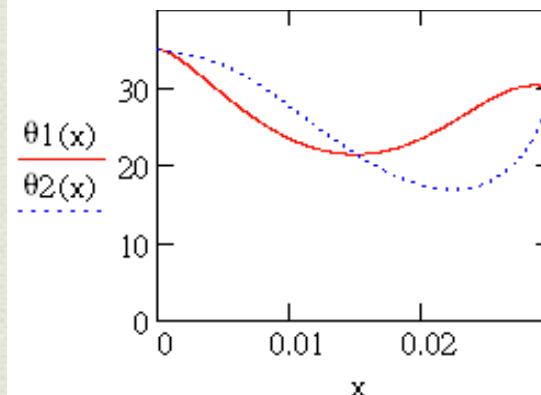

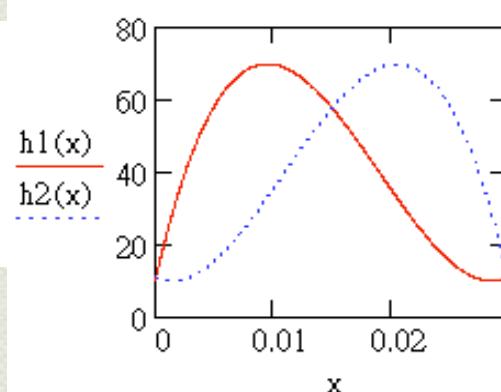

Conclusion :
 Case 1 is better in heat dissipation
 with $Q_2 = 2.55W$, $Q_1 = 2.18W$, about
 17% improvement!

$$Q = h A dT$$

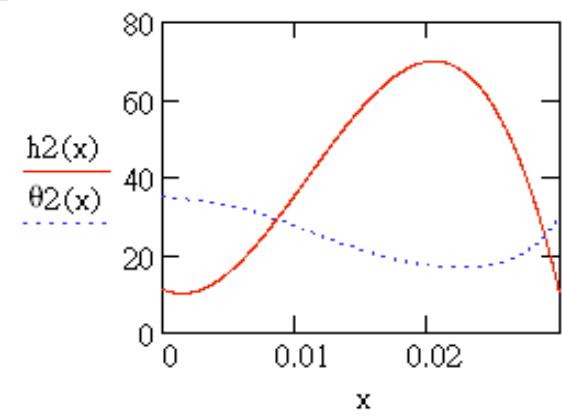

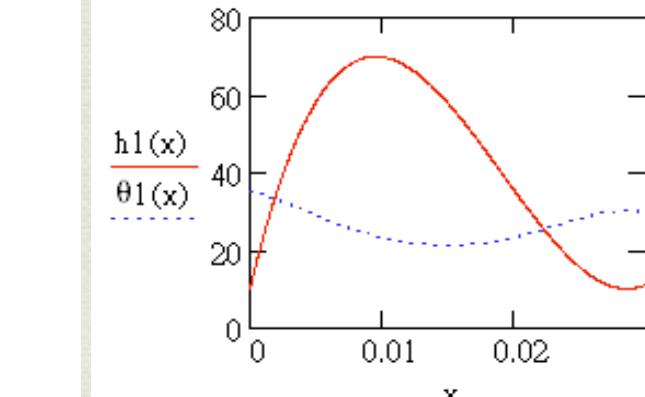

When Q is 3W, what is the T_b ?

$$\theta_{01} := \frac{Q}{\int_0^b h1(x) \cdot 2L \cdot \left[\frac{\cosh[m1(x) \cdot (b-x)]}{\cosh(m1(x) \cdot b)} \right] dx} + T_a = 76.136$$

$$\theta_{02} := \frac{Q}{\int_0^b h2(x) \cdot 2L \cdot \left[\frac{\cosh[m2(x) \cdot (b-x)]}{\cosh(m2(x) \cdot b)} \right] dx} + T_a = 83.158$$

$$\theta1(x) := \theta_0 \cdot \frac{\cosh[m1(x) \cdot (b-x)]}{\cosh(m1(x) \cdot b)}$$

$$\theta2(x) := \theta_0 \cdot \frac{\cosh[m2(x) \cdot (b-x)]}{\cosh(m2(x) \cdot b)}$$

$$Q1 := \int_0^b h1(x) \cdot 2L \cdot \theta1(x) dx = 2.553 \quad Q2 := \int_0^b h2(x) \cdot 2L \cdot \theta2(x) dx = 2.18$$

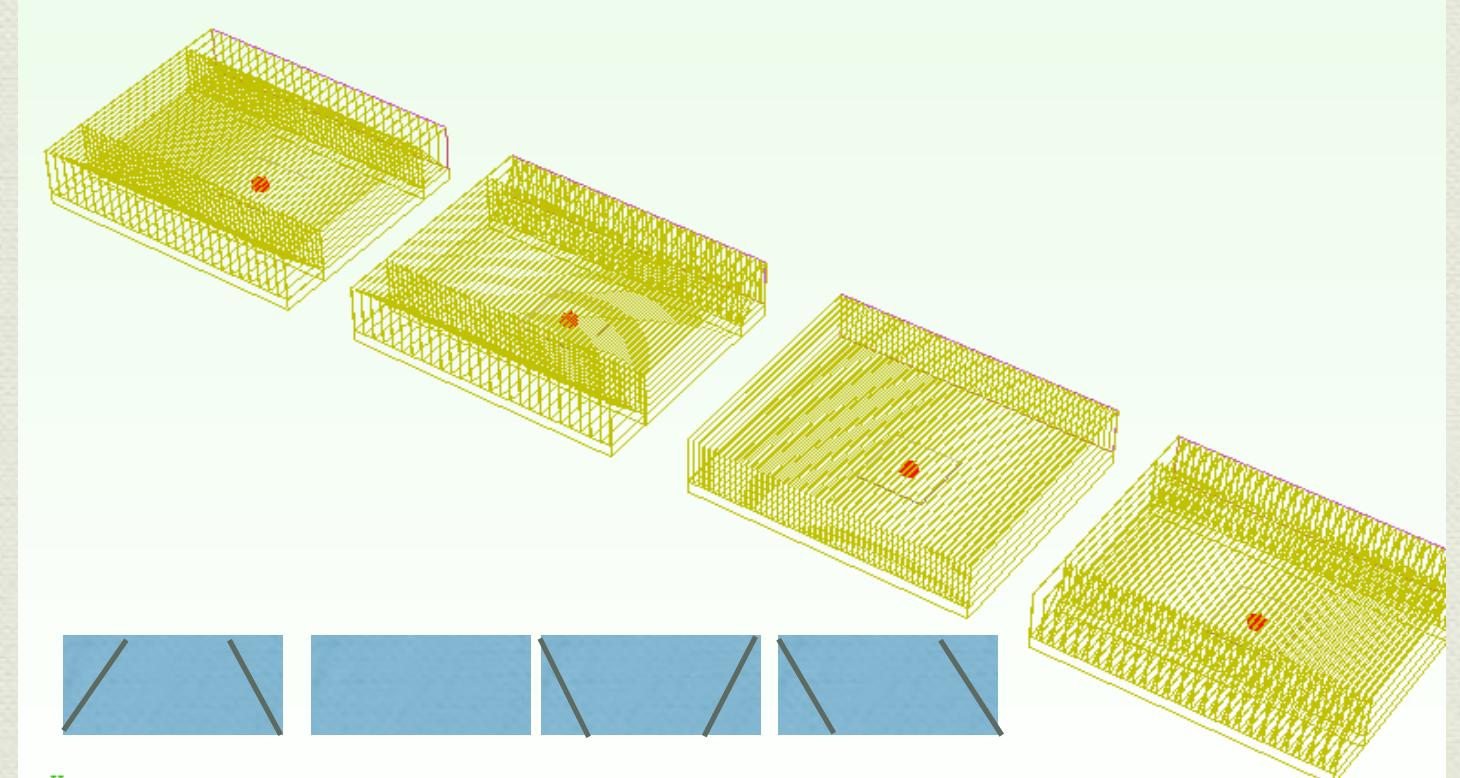

Server Original Samples

- ◆ dimension: 107Wx91Lx25H
- ◆ base thickness : 5MM
- ◆ base material: AL + Heatpipe
- ◆ FIN:91x20Hx0.2Tx53F
- ◆ fin material: AL

SIMULATION MODEL

- ◆ dimension: 107Wx91Lx25H
- ◆ base thickness : 5MM
- ◆ base material: CU
- ◆ FIN:91x20Hx0.2Tx53F
- ◆ fin material: AL
- ◆ DIE size: 25X25MM
- ◆ power: 100W
- ◆ Fan: 40X40, 30CFM/45Pa

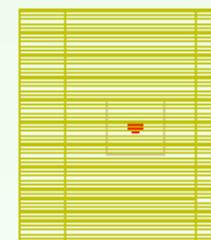

Simulation Models

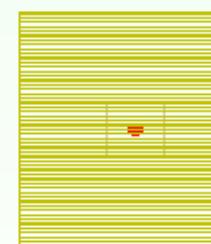

- #1 Front down-cut 45 degree / Back up-cut 30 degree

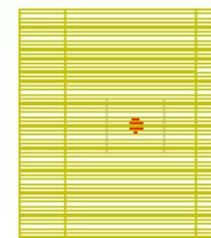

- #2 Front down-cut 45 degree / Back down-cut 30 degree

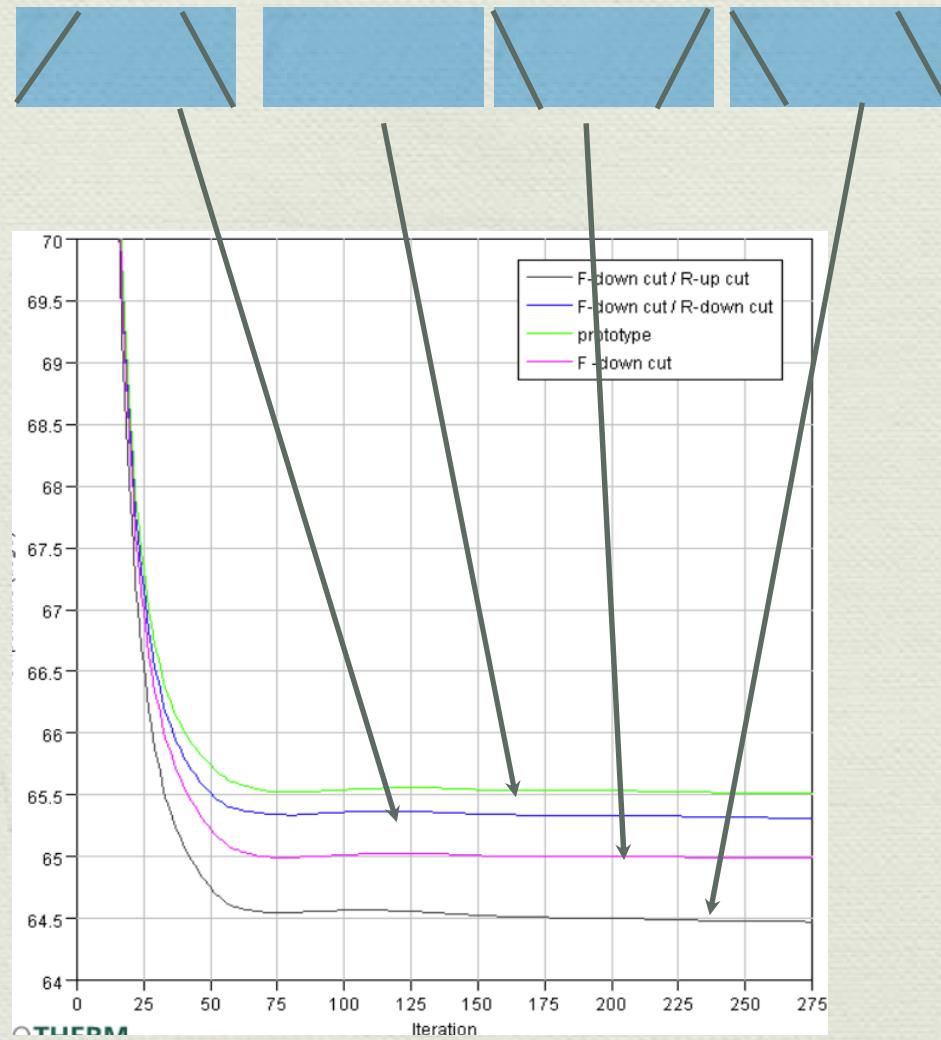

- #3 Prototype no cut

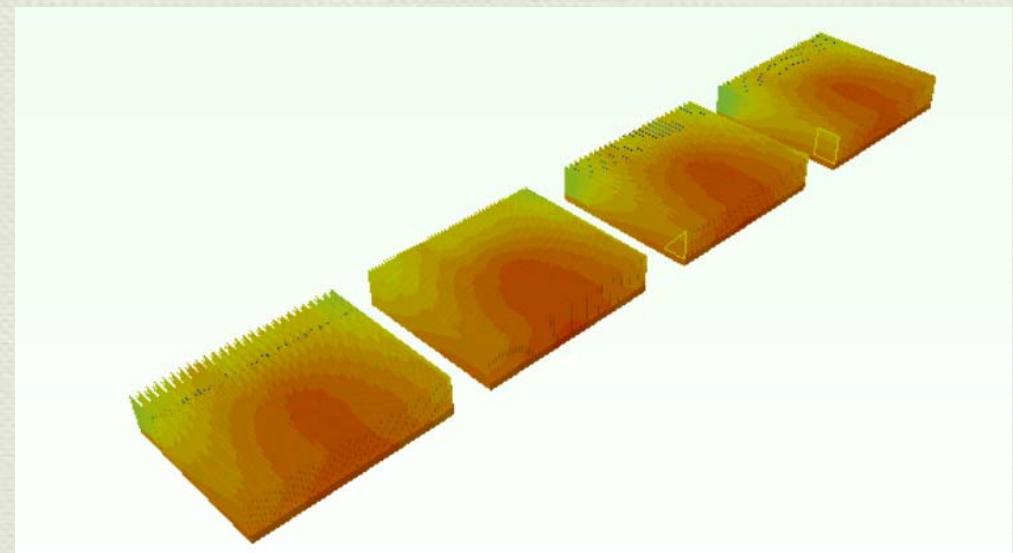

- #4 Front up-cut 45 degree / Back up-cut 30 degree

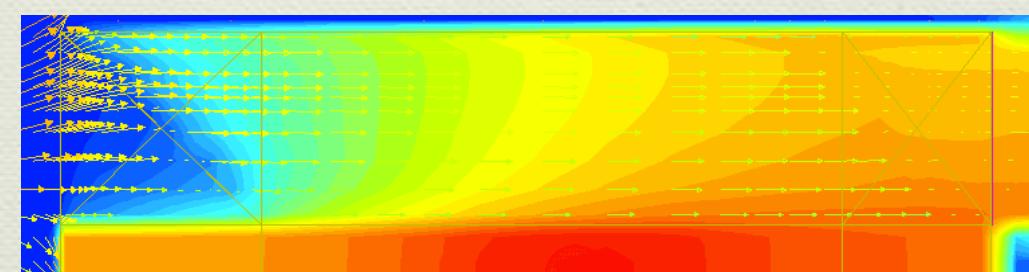

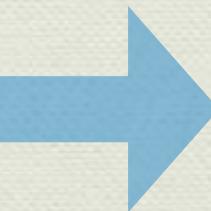

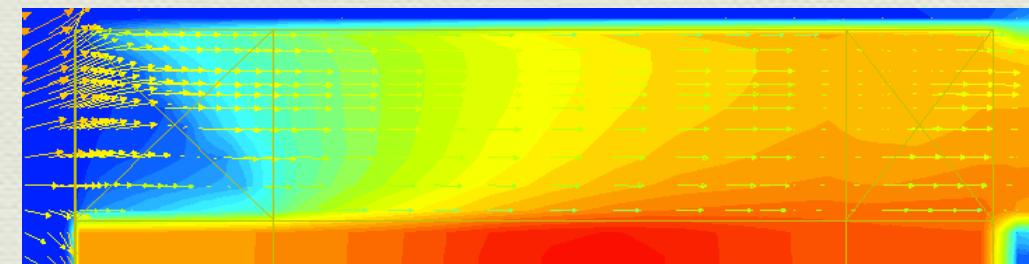

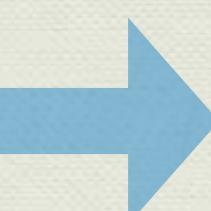

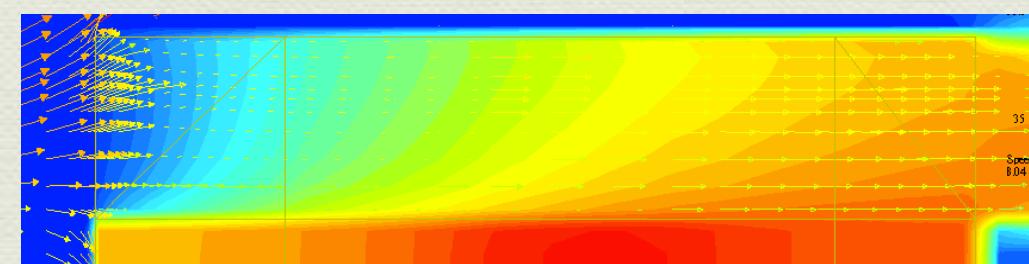

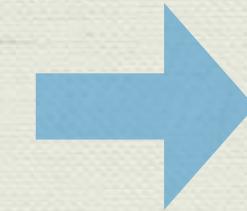

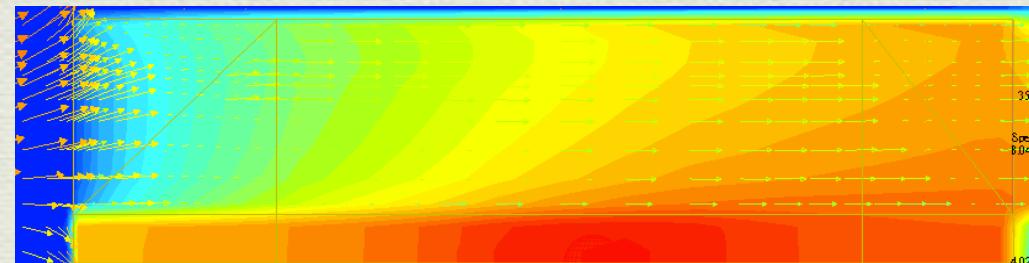

Result Analysis

Volume Flow High (cfm)	Mass Flow High (kg/s)	Heat Flow High (W)	Temperature High (deg C)
9.52733	0.0052221	277.53	52.868
8.89739	0.0048768	264.64	53.985
